

The tradeoff between security and usability, with the increase in use of the internet people have become more aware of the dangers of data theft.

1) Authentication complicity: The level of authentication can add more security but at the risk of usability since users might find it tedious to access their data through a multi-level authentication.

2) Error Rates and User Feedback: Checking the error rates and taking user feedback is important which allows for Developers should balance security with user convenience.

3) Cost and security: The cost of adding new security measures will be higher so a developer needs to decide between keeping within the budget or going over it to add security features.
